1 Session S8.1: power and battery management: Process cruise control:

A event-driven clock scaling for dynamic power management Andreas Weissel, Frank Bellosa

Proceedings of the international conference on Compilers, architecture, and synthesis for embedded systems October 2002

Scalability of the core frequency is a common feature of low-power processor architectures. Many heuristics for frequency scaling were proposed in the past to find the best trade-off between energy efficiency and computational performance. With complex applications exhibiting unpredictable behavior these heuristics cannot reliably adjust the operation point of the hardware because they do not know where the energy is spent and why the performance is lost. Embedded hardware monitors in the form of ...

Modeling, simulation, sensitivity analysis, and optimization of hybrid **A** systems

84%

85%

Paul I. Barton , Cha Kun Lee

ACM Transactions on Modeling and Computer Simulation (TOMACS) October 2002 Volume 12 Issue 4

Hybrid (discrete/continuous) systems exhibit both discrete state and continuous state dynamics which interact to such a significant extent that they cannot be decoupled and must be analyzed simultaneously. We present an overview of the work that has been done in the modeling, simulation, sensitivity analysis, and optimization of hybrid systems, paying particular attention to the interaction between discrete and continuous dynamics. A concise intuitive framework for hybrid system modeling is pres ...

3 System-level power optimization: techniques and tools Luca Benini, Giovanni de Micheli

83%

ACM Transactions on Design Automation of Electronic Systems (TODAES) April 2000

Volume 5 Issue 2

This tutorial surveys design methods for energy-efficient system-level design. We consider electronic sytems consisting of a hardware platform and software layers. We consider the three major constituents of hardware that consume energy, namely computation, communication, and storage units, and we review methods of reducing their energy consumption. We also study models for analyzing the energy cost of software, and methods for energy-efficient software design and compilation. This survery ...

4 System support for automatic profiling and optimization Xiaolan Zhang , Zheng Wang , Nicholas Gloy , J. Bradley Chen , Michael D. Smith ACM SIGOPS Operating Systems Review, Proceedings of the sixteenth ACM symposium on Operating systems principles October 1997 Volume 31 Issue 5

5 Continuous program optimization: A case study

Thomas Kistler , Michael Franz

ACM Transactions on Programming Languages and Systems (TOPLAS) July 2003 Volume 25 Issue 4

Much of the software in everyday operation is not making optimal use of the hardware on which it actually runs. Among the reasons for this discrepancy are hardware/software mismatches, modularization overheads introduced by software engineering considerations, and the inability of systems to adapt to users' behaviors.A solution to these problems is to delay code generation until load time. This is the earliest point at which a piece of software can be fine-tuned to the actual capabilities of the ...

6 Performance evaluation of dynamic routing based on the use of বী satellites and intelligent networks

82%

L. Bella, F. Chummun, M. Conte, G. Fischer, J. Rammer Wireless Networks February 1998

Volume 4 Issue 2

A dynamic routing scheme for public switched telephone networks is introduced which employs satellite broadcast to distribute network load data. The proposed network architecture closely resembles the IN (Intelligent Network) architecture, whereby the IN SCPs (Service Control Points) serve as so-called Routing Control Points (RCPs). The key functions of an RCP are (i) to execute the routing algorithm and issue routing instructions in response to routing queries it receives from its associat ...

80%

Application domains for fixed-length block structured architectures Lieven Eeckhout , Tom Vander Aa , Bart Goeman , Hans Vandierendonck , Rudy Lauwereins, Koen De Bosschere

Australian Computer Science Communications, Proceedings of the 6th Australasian conference on Computer systems architecture January 2001 Volume 23 Issue 4

In order to tackle the growing complexity and interconnects problem in modern microprocessor architectures, computer architects have come up with new architectural paradigms. A fixed-length block structured architecture (BSA) is one of these paradigms. The basic idea of a BSA is to generate blocks of instructions, called BSA-blocks, statically (by the compiler) and executing these blocks on a decentralized microarchitecture. In this paper, we focus on possible application domains for this

archit ...

8 Multimedia and graphics: Enhancing loop buffering of media and telecommunications applications using low-overhead predication John W. Sias , Hillery C. Hunter , Wen-mei W. Hwu

80%

Proceedings of the 34th annual ACM/IEEE international symposium on Microarchitecture December 2001

Media- and telecommunications-focused processors, increasingly designed as deeply pipelined, statically-scheduled VLIWs, rely on loop buffers for low-overhead execution of simple loops. Key loops containing control flow pose a substantial problem---full predication has a high encoding overhead, and partial predication techniques do not support if-conversion, the transformation of general acyclic control flow into predicated blocks. Using a set of significant media processing benchmarks, drawn fr ...

Multimedia and graphics: Saving energy with architectural and

80%

frequency adaptations for multimedia applications Christopher J. Hughes, Jayanth Srinivasan, Sarita V. Adve

Proceedings of the 34th annual ACM/IEEE international symposium on Microarchitecture December 2001

General-purpose processors are expected to be increasingly employed for multimedia workloads on systems where reducing energy consumption is an important goal. Researchers have proposed the use of two forms of hardware adaptation architectural adaptation and dynamic voltage (and frequency) scaling or DVS - to reduce energy. This paper develops and evaluates an integrated algorithm to control both architectural adaptation and DVS targeted to multimedia applications. It also examines the interac ...

10 Session 6B: Convergence of abstractions in high-level synthesis:

80%

Application-driven processor design exploration for power-performance trade-off analysis

Diana Marculescu, Anoop Iyer

Proceedings of the 2001 IEEE/ACM international conference on Computer-aided design November 2001

This paper presents an efficient design exploration environment for high-end core processors. The heart of the proposed design exploration framework is a two-level simulation engine that combines detailed simulation for critical portions of the code with fast profiling for the rest. Our two-level simulation methodology relies on the inherent clustered structure of application programs and is completely general and applicable to any microarchitectural power/performance simulation engine. The prop ...

11 Modelling and performance evaluation of mobile multimedia systems

80%

ৰী using QoS-GSPN

Tony Tsana

Wireless Networks November 2003

Volume 9 Issue 6

Quality of Service (QoS) measurement of multimedia applications is one of the most important issues for call handoff and call admission control in mobile networks. Based on the QoS measures, we propose a Generalized Stochastic Petri Net (GSPN) based model, called QoS-GSPN, which can express the real-time behavior of QoS measurement for mobile networks. QoS-GSPN performance analysis methodology includes the formal expression and performance analysis environment. It offers the

promise of providing ...

12 Profile-Based Dynamic Voltage Scheduling Using Program Checkpoints

80%

A. Azevedo , I. Issenin , R. Cornea , R. Gupta , N. Dutt , A. Veidenbaum , A. Nicolau Proceedings of the conference on Design, automation and test in Europe March 2002

Dynamic voltage scaling (DVS) is a known effectivemechanism for reducing CPU energy consumption withoutsignificant performance degradation. While a lot of workhas been done on inter-task scheduling algorithms to implementDVS under operating system control, new researchchallenges exist in intra-task DVS techniques under softwareand compiler control. In this paper we introduce anovel intra-task DVS technique under compiler control usingprogram checkpoints. Checkpoints are generated atcompile time ...

13 Integrated program measurement and documentation tools

80%

Anne Schroeder

Proceedings of the 7th international conference on Software engineering March

This paper describes an attempt to integrate the collection and the efficient utilisation of measurements in the development and the use of programs. The work presented consists in three parts: - the design of both static and dynamic measurement tools, examples of data processing on measurements collected on a sample of Pascal programs, - the design of a quantitative documentation of a program, which is automatically built as measurements are collected.

14 Characterizations of parallelism in applications and their use in

80%

ৰী scheduling

K. C. Sevcik

ACM SIGMETRICS Performance Evaluation Review, Proceedings of the 1989 ACM SIGMETRICS international conference on Measurement and modeling of computer systems April 1989

Volume 17 Issue 1

As multiprocessors with large numbers of processors become more prevalent, we face the task of developing scheduling algorithms for the multiprogrammed use of such machines. The scheduling decisions must take into account the number of processors available, the overall system load, and the ability of each application awaiting activation to make use of a given number of processors. The parallelism within an application can be characterized at a number of different levels of detail ...

15 Compilation and run-time systems: Vacuum packing: extracting

80%

A hardware-detected program phases for post-link optimization Ronald D. Barnes, Erik M. Nystrom, Matthew C. Merten, Wen-mei W. Hwu Proceedings of the 35th annual ACM/IEEE international symposium on Microarchitecture November 2002

This paper presents Vacuum Packing, a new approach to profile-based program optimization. Instead of using traditional aggregate or summarized execution profile weights, this approach uses a transparent hardware profiler to automatically detect execution phases and record branch profile information for each new phase. The code extraction algorithm then produces code packages that are specially formed for their corresponding phases. The algorithm compensates for the incomplete and often incoheren ...

16 SIGSAM BULLETIN: Computer algebra in the life sciences

80%

Michael P. Barnett

ACM SIGSAM Bulletin December 2002

Volume 36 Issue 4

This note (1) provides references to recent work that applies computer algebra (CA) to the life sciences, (2) cites literature that explains the biological background of each application, (3) states the mathematical methods that are used, (4) mentions the benefits of CA, and (5) suggests some topics for future work.

17 Application-adaptive intelligent cache memory system

80%

Jung-Hoon Lee , Shin-Dug Kim , Charles Weems

ACM Transactions on Embedded Computing Systems (TECS) November 2002 Volume 1 Issue 1

This article presents the design of a simple hardware-controlled, high performance cache system. The design supports fast access time, optimal utilization of temporal and spatial localities adaptive to given applications, and a simple dynamic fetching mechanism with different fetch sizes. Support for dynamically varying the fetch size makes the cache equally effective for general-purpose as well as multimedia applications. Our cache organization and operational mechanism are especially designed ...

80%

বা architectures in multiagent systems

Jonathan Carter, Ali A. Ghorbani, Stephen Marsh

Proceedings of the first international joint conference on Autonomous agents and multiagent systems: part 2 July 2002

ACORN (Agent-based Community Oriented Routing Network) is a distributed multiagent architecture for the search, distribution and management of information across networks. ACORN utilises the concept of 'information as agent' together with an application of Stanley Milgram's Small World Problem (the idea of the Six Degrees of Separation) in order to route individual items of information around a network of people and agents. This paper describes additions made to the ACORN architecture and the i ...

19 Task assignment with unknown duration

80%

Journal of the ACM (JACM) March 2002

Volume 49 Issue 2

We consider a distributed server system and ask which policy should be used for assigning jobs (tasks) to hosts. In our server, jobs are not preemptible. Also, the job's service demand is not known a priori. We are particularly concerned with the case where the workload is heavy-tailed, as is characteristic of many empirically measured computer workloads. We analyze several natural task assignment policies and propose a new one TAGS (Task Assignment based on Guessing Size). The TAG ...

20 High-quality operation binding for clustered VLIW datapaths

80%

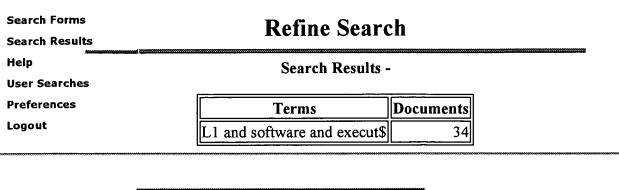

Viktor S. Lapinskii , Margarida F. Jacome , Gustavo A. de Veciana

Proceedings of the 38th conference on Design automation June 2001 Clustering is an effective method to increase the available parallelism in VLIW datapaths without incurring severe penalties associated with large number of register file ports. Efficient utilization of a clustered datapath requires careful binding of operations to clusters. The paper proposes a binding algorithm that effectively explores tradeoffs between in-cluster operation serialization and delays associated with data transfers between clusters. Extensive experimental evidence is provid ...
